PROFESSIONAL SUMMARY

Back-End Java Developer with 5+ years building production-grade backend systems for high-availability environments. Strong hands-on background designing and shipping RESTful APIs and microservices with Spring Boot, deploying across AWS, Docker, OpenShift, and Kubernetes, and maintaining CI/CD pipelines with Jenkins, TeamCity, SonarQube, and Bitbucket. Comfortable working through the full SDLC: feasibility, design, build, test, deployment, inside Agile teams, with practical exposure to multithreading, thread-pool tuning, and event-driven architecture for latency-sensitive workloads.

TECHNICAL SKILLS

Languages & Frameworks: Java (8/11/17), Spring Boot, Spring MVC, Spring Security, Hibernate/JPA, JavaScript
APIs & Architecture: RESTful API design, microservices, service-oriented architecture, event-driven patterns (Kafka)
Cloud & Containers: AWS (EC2, ECS, S3, RDS), Docker, OpenShift, Kubernetes
CI/CD & Quality Assurance: Jenkins, TeamCity, SonarQube, Bitbucket, Git, automated testing (JUnit, Mockito)
Concurrency & Performance: Multithreading, thread-pool management, low-latency/high-throughput system design
Data Storage: PostgreSQL, Oracle, MongoDB, Redis (in-memory caching)
Practices: Agile/Scrum, code review, secure application design, Unix shell scripting
Design & Prototyping: Figma, Adobe XD, low-fidelity & high-fidelity wireframing, usability testing, design systems
Tooling: Git/GitHub, CI/CD pipelines, code review, cross-browser debugging, performance optimization
AI-Assisted Workflow: Prompt-driven design iteration and code scaffolding using generative AI design assistants

EDUCATION

University of Alberta, Edmonton, AB Canada

2022 - 2026

Bachelor of Science in Computing Science

Coursework: Advanced Software Engineering, Security Systems, Database Management, Algorithm Design

WORK EXPERIENCE

Back-End Java Developer

Sep 2024 - Present

Infinity Accounting Services

Edmonton, AB Canada | Java, Spring Boot, AWS, Kubernetes, Kafka

- Designed and built RESTful microservices in Java/Spring Boot supporting core transaction-processing workflows for a retail banking platform, handling several million requests per day.
- Containerized services with Docker and deployed to Kubernetes and OpenShift clusters, coordinating rollout strategy with the platform team to keep downtime near zero during releases.
- Tuned thread-pool config and JVM settings on a critical latency payment service, reducing p99 peak load response time.
- Kafka event streaming to decouple downstream reporting & transaction path, for system resilience during traffic spikes.
- Maintained CI/CD in Jenkins with SonarQube quality gates and Bitbucket code review, cutting regression escapes to QA.
- Worked directly with security engineering to implement authentication/authorization controls (OAuth2/JWT) and pass periodic application security reviews.
- Participated in Agile ceremonies and contributed estimates for feasibility and planning of new backend features.

Java Developer

Jun 2020 - Jan 2023

Optimum Group

Edmonton, AB Canada | Java, Spring Boot, Docker, AWS

- Built and maintained RESTful services in Spring Boot for an internal claims-processing system, working across the full SDLC from requirements through deployment.
- Migrated a monolithic Java application into a set of containerized microservices on AWS ECS, improving independent deployability and reducing release cycle time.
- Wrote unit and integration tests (JUnit, Mockito) as part of a CI pipeline, raising automated test coverage on core modules.
- Collaborated in cross-functional teams to translate requirements into technical designs, and validation of delivered features.
- Used Unix shell scripting to automate routine deployment and log-analysis tasks across environments.

ACADEMIC & PERSONAL PROJECTS

Distributed Order-Processing System (University of Alberta coursework)

2023

Java, Spring Boot, Docker, PostgreSQL, RabbitMQ

- Designed an order-processing prototype with independent Java microservices communicating via REST + message queue.
- Containerized each service with Docker and documented Kubernetes-ready deployment layout as for systems-design.
